Getting tired of maintaining instead of using my laptop ... for work ! I mean I have a fixed configuration fvwm/urxvt/screen/Xressources/screen for years and every 1 or 2 month suddenly a “change” is breaking stuffs... like renaming font names, systemd etc... I grow tired of spending hours trying to fix it so I switched my work laptop on Debian testing. Installation went flawlessly, it's a bit long. but I took the opportunity to switch / and /var on btrfs. The only “issue” here is systemd, I guess I will have to deal with this ultimate useless shit after all...

Post install

wifi realtek

I had to follow this tutorial to have the wifi working

Gnome Shell

I added/ enabled nice feature of the gnome shell:

- Auto-move windows
- Drop down terminal
- Lock keys (as I often enable the stoopid caps lock key instead of typing “a”)
- Workspace indicator
- Pomodoro (does not install... no error message)
- Dash to Dock
- Open Weather
- TopIcons Plus
- Web Search Dialog (does not install... no error message)
- SystemMonitor (does not install... no error message)
- Netspeed
- Sensors (does not install... no error message)

The installation process is a joke... when it fails to install well no message ! good work, who cares about logs anyway 💪 Reading this thread makes it even more 💪 ... really

I will add more following The Best 35 GNOME Extensions Review
